LEARNING DIARY, FULL-STACK MODULE

LEARNING DIARY

17.6.2026

Activity: **Starting of the course**

I started the course, because on web application courses before this, I hadn't been able to connect to MongoDB databases and make actual databases.

25.6.2026.

Activity: **Node.js crash course**

A good refresher on what node is and how it can be used. Basically skipped through the video, but clones the repo and tinkered with it a little.

30.6.2026.

Activity: **MongoDB and Express**

MongoDB refresher really did come as a good learning experience. I had created the database cluster beforehand, so it was a little difficult to learn how to use it again.

Express crash course gave some good guidelines to use such as the status codes and using them with a meaning. Also routing, middleware and controllers were a good refresher.

13.7.2026

Activity: **React crash course**

Again a refresher video came really handy, but in the end I decided to use Vite as the file creator for the actual project app. Couldn't get the video's repo working (some kind of version failure I guess) but tried to tinker with it a little.

15.7.2026

Activity: **Starting the project, by using the MERN video**

Started with the MERN video, created my React front with vite, Main stuff happens on the About Me -page. About me data is stored in MongoDB and acquired using the getAboutMe -method, in aboutController.js.

Front end functionalities include downloading resume, scrollToTop button, dark mode and having a Not Found page for when a user tries to find a page that doesn't exist.

The repo includes the seeding algorithm and a ReadMe file that enable the user to view the website as intended after connecting their MongoDB database.
